

## *Smartstox.com Spotlights Exploration Success at Amador Gold Corp.*

### **Drills Restart at Loveland**

Vancouver, British Columbia, April 17, 2008. The Smartstox Online TV Talk Show is alerting subscribers and other resource stock investors to recent developments announced by this Smartstox-profiled company.

**Amador Gold Corp. (TSX VENTURE: AGX)** has staked further ground to the west of their recent copper-nickel discovery on the Byers-Loveland Project, 35 km northwest of Timmins, Ontario. They now have tied up all the ground between the Byers Loveland property and Xstrata's Montcalm operating mine, 30 km to the west.

In March, Amador announced a discovery intercept at the project of 45.0 metres of 0.75% copper and 0.70% nickel, some 50 meters below a known resource discovered and outlined by Cominco in the 1970's. The discovery shows that mineralization continues below the Cominco mineralization, and that grades and widths appear to improve at depth.

Earlier in the month Amador bought a neighboring property that hosts the Hollinger copper-nickel occurrence, which also had been drilled in the 1970s and is on-strike with the with the Byers-Loveland mineralization.

Encouraged by excellent drill results Amador will be drilling now to increase strike length of their discovery at Byers-Loveland, as well as to investigate below the known Hollinger mineralization to determine if it too continues at depth. The company will also soon be conducting a state-of-the-art VTEM B-field airborne geophysical survey over all the areas holdings.

John Keating Director of Amador Gold, tells us about the company's many projects involving base and precious metals, at <http://www.smartstox.com/interviews/agx.php>
